
Improving ammonia emission prediction
Chapter 1
Static prediction
Predict cumulative emissions
Compare machine learning with ALFAM2
Chapter 2
Dynamic prediction
Predict complete emission trajectories
Account for time-varying meteorological conditions
Chapter 4
Physical consistency
Non-negative fluxes
Emissions bounded by TAN
Temporal causality
Transfer to conditions with limited target data
Chapter 3
Limited data availability
Evaluate transfer learning across fertilizer origins
Exploit heterogeneous observations
Practical implementation
nh3pred
Python package
